Microhabitats

# HABITATS

## Sticky knowledge facts:

A habitat is a place that an animal lives. It provides the animal with food, water and shelter.

There are many different sorts of habitats around the world, from forests to grasslands and from mountain slopes to deserts.

Animals like cockroaches are really important in a habitat because they eat the dead plants and recycle the nutrients back into the soil.

People are causing harm to many habitats. Forests are being burnt down, lakes and rivers polluted and the polar ice caps are melting.

Because the Earth is always changing, habitats are constantly changing.
